

Chapter 10: File-System Interface 文件系统接口

Chapter 10: File-System Interface

- 10.1 File Concept
- 10.2 Access Methods
- 10.3 Directory Structure
- 10.4 File-System Mounting
- 10.5 File Sharing
- 10.6 Protection

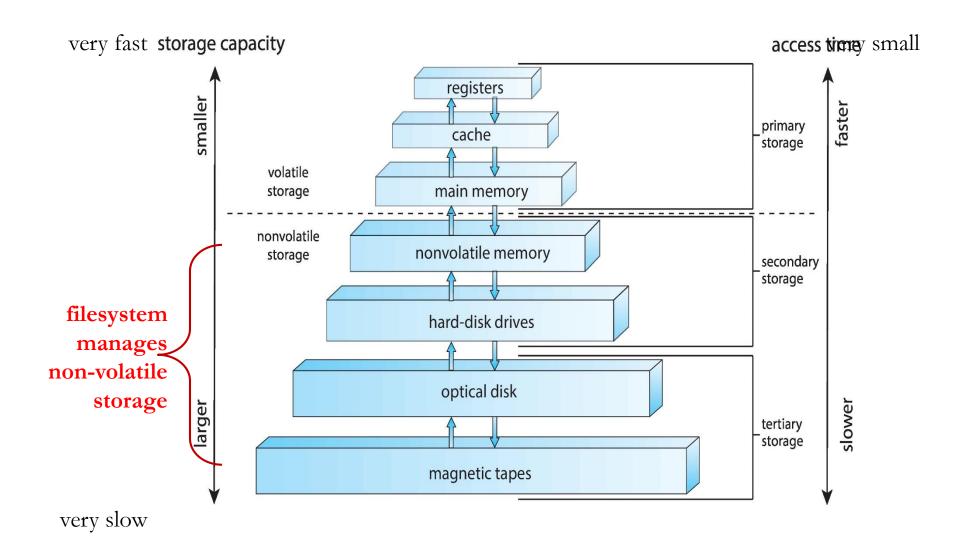

Objectives

- To explain the function of file systems
- To describe the interfaces to file systems
- To discuss file-system design tradeoffs, including access methods, file sharing, file locking, and directory structures
- To explore file-system protection

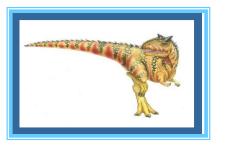

Hierarchical Storage Architecture

10.1 File Concept

File Concept (文件概念)

- ■文件是存储某种介质上的(如磁盘、光盘、SSD等)并具有文件名的一组相关信息的集合
- A file is a sequence of bytes stored on some device

- Types:
 - Data
 - numeric
 - character
 - binary
 - Program

File Attributes(文件属性)

File metadata 文件元数据

- Name only information kept in human-readable form
- Identifier unique tag (number) identifies file within file system
- **Type** needed for systems that support different types
- Location pointer to file location on device
- **Size** current file size
- Protection controls who can do reading, writing, executing
- **Time, date, and user identification** data for protection, security, and usage monitoring
- Information about files are kept in the directory structure, which is maintained on the disk

File Operations(文件操作)

- File is an abstract data type (抽象数据类型)
 - Create
 - Write
 - Read
 - Reposition within file
 - Delete
 - Truncate
 - $Open(F_i)$ search the directory structure on disk for entry F_i , and move the content of entry to memory
 - Close (F_i) move the content of entry F_i in memory to directory structure on disk

Open Files

- Several pieces of data are needed to manage open files:
 - File pointer: pointer to last read/write location, per process that has the file open
 - File-open count: counter of number of times a file is open to allow removal of data from open-file table when last processes closes it
 - Disk location of the file: cache of data access information
 - Access rights: per-process access mode information

File Types (文件类型)

file type	usual extension	function	
executable	exe, com, bin or none	ready-to-run machine- language program	
object	obj, o	compiled, machine language, not linked	
source code	c, cc, java, pas, asm, a	source code in various languages	
batch	bat, sh	commands to the command interpreter	
text	txt, doc	textual data, documents	
word processor	wp, tex, rtf, doc	various word-processor formats	
library	lib, a, so, dll	libraries of routines for programmers	
print or view	ps, pdf, jpg	ASCII or binary file in a format for printing or viewing	
archive	arc, zip, tar	related files grouped into one file, sometimes compressed, for archiving or storage	
multimedia	mpeg, mov, rm, mp3, avi	binary file containing audio or A/V information	

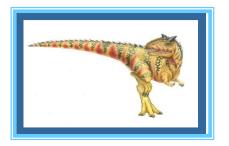

File Structure (文件内部结构、文件逻辑结构)

- None sequence of words, bytes (流文件结构)
- Simple record structure (记录文件结构)
 - Lines
 - Fixed length
 - Variable length
- **Complex Structures**
 - Formatted document
 - Relocatable load file
- Can simulate last two with first method by inserting appropriate control characters
- Who decides:
 - Operating system
 - Program

10.2 Access Methods (文件的访问方法)

Access Methods

■ Sequential Access (顺序存取) Fig 10.2

```
read next
write next
reset
no read after last write
(rewrite)
```

■ Direct Access (直接存取) Fig 10.3

```
read n
write n
position to n
read next
write next
rewrite n
```

n = relative block number Fig 10.4

■ Indexed sequential-acess (索引顺序)

Fig 10.2 Sequential-access File

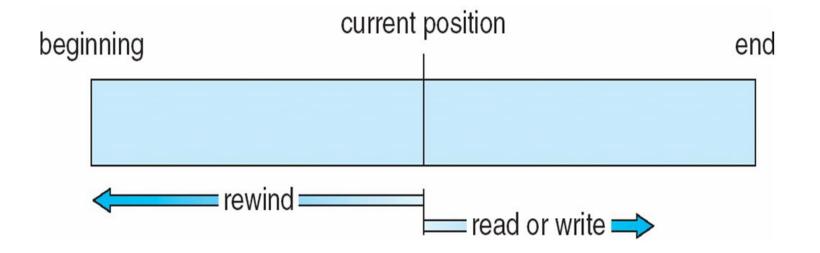

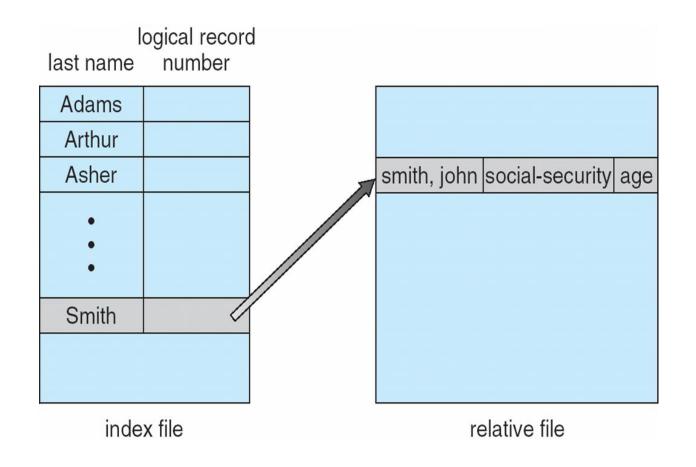

Fig 10.3 Simulation of Sequential Access on Direct-access File

sequential access	implementation for direct access
reset	cp = 0;
read next	read cp ; cp = cp + 1;
write next	write cp ; cp = cp + 1;

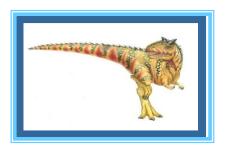

Fig 10.4 Example of Index and Relative Files

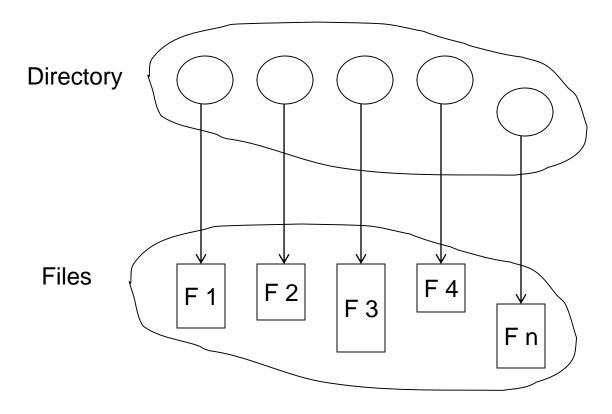

10.3 Directory Structure (目录结构)

Directory Structure

A collection of nodes containing information about all files

Both the directory structure and the files reside on disk Backups of these two structures are kept on tapes

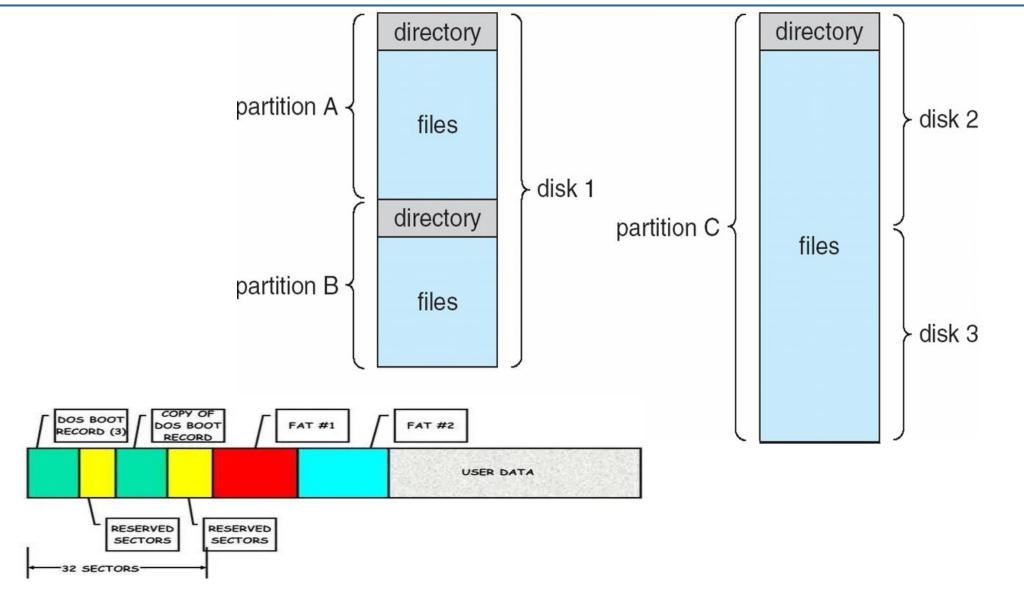

Disk Structure

- Disk can be subdivided into partitions (分区)
- Disks or partitions can be RAID protected against failure
- Disk or partition can be used raw without a file system, or formatted with a file system
- Partitions also known as minidisks, slices
- Entity containing file system known as a volume
- Each volume containing file system also tracks that file system's info in device directory or volume table of contents
- As well as general-purpose file systems there are many special-purpose file systems, frequently all within the same operating system or computer

A Typical File-system Organization

Operations Performed on Directory

- ✓ Search for a file
- ✓ Create a file
- ✓ Delete a file
- ✓ List a directory
- ✓ Rename a file
- ✓ Traverse the file system (遍历文件系统)

Organize the Directory (Logically) to Obtain

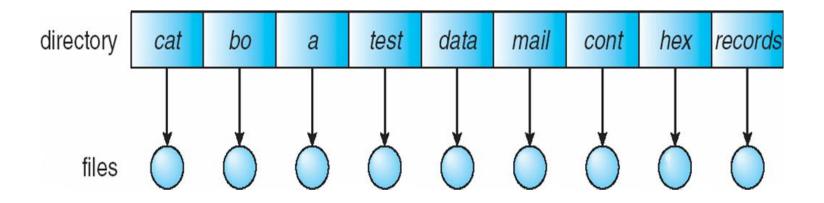

- Efficiency locating a file quickly
- Naming (重名) convenient to users
 - Two users can have same name for different files
 - The same file can have several different names
- Grouping (分组) logical grouping of files by properties, (e.g., all Java programs, all games, …)

Single-Level Directory (单级目录)

A single directory for all users

Naming problem

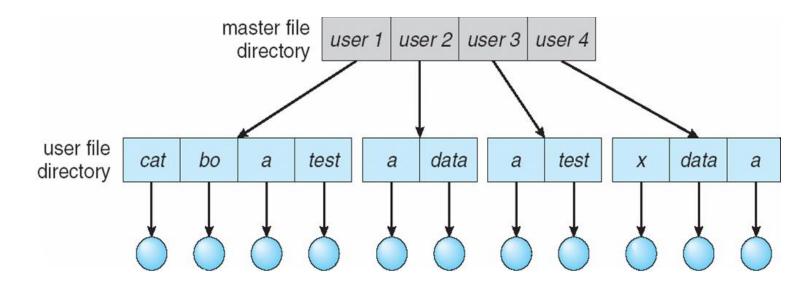

Grouping problem

Two-Level Directory (二级目录)

Separate directory for each user

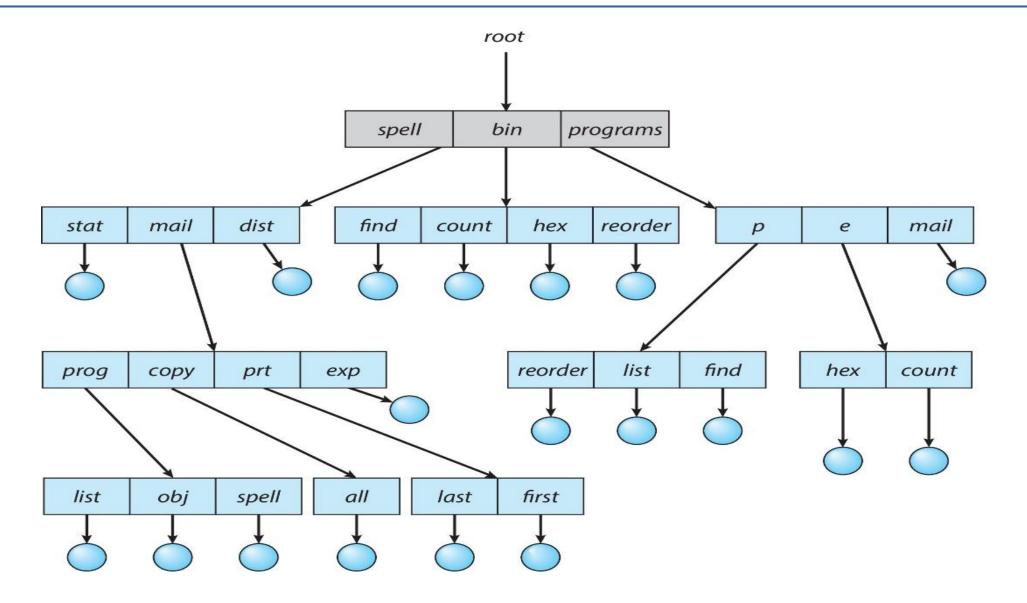

- Path name
- Can have the same file name for different user
- Efficient searching
- No grouping capability

Tree-Structured Directories (树型目录)

Tree-Structured Directories (Cont)

- Efficient searching
- Grouping Capability
- Current directory (working directory)
 - cd /spell/mail/prog
 - type list

Tree-Structured Directories (Cont)

- **Absolute** or **relative** path name 绝对路径、相对路径
- Creating a new file is done in current directory
- Delete a file

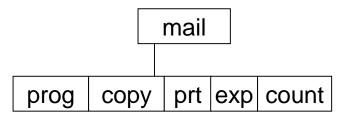

rm <file-name>

Creating a new subdirectory is done in current directory

mkdir <dir-name>

Example: if in current directory /mail

mkdir count

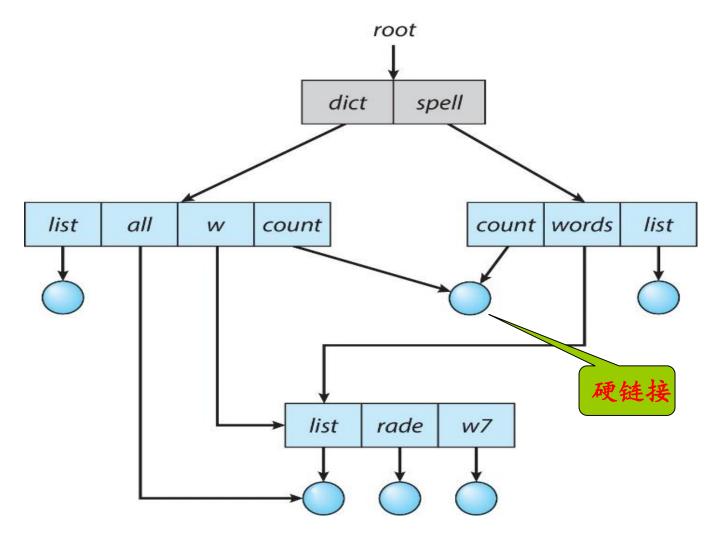

Deleting "mail" ⇒ deleting the entire subtree rooted by "mail"

Acyclic-Graph Directories无环图结构目录

Have shared subdirectories and files

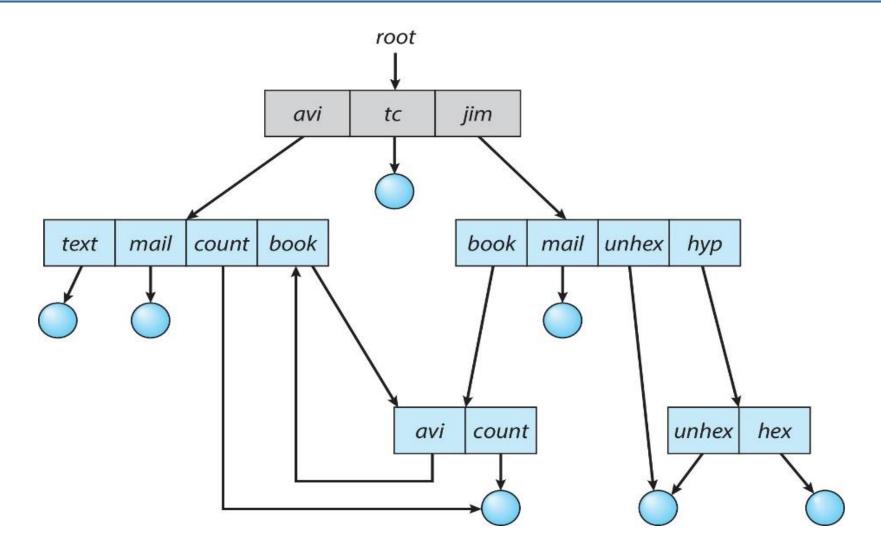

Acyclic-Graph Directories (Cont.)

- Two different names (aliasing)
- If dict deletes all ⇒ dangling pointer Solutions:
 - Backpointers (逆向指针), so we can delete all pointers
 Variable size records a problem
 - Backpointers using a daisy chain organization
 - Entry-hold-count solution (表项保留计数)
 - unix linux:hard links
- New directory entry type
 - Link another name (pointer) to an existing file
 - Resolve the link follow pointer to locate the file

General Graph Directory (普通图结构目录)

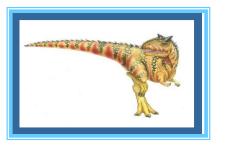

General Graph Directory (Cont.)

- How do we guarantee no cycles?
 - Allow only links to file not subdirectories
 - Garbage collection
 - Every time a new link is added use a cycle detection algorithm (环检测算法) to determine whether it is OK

10.4 File System Mounting

File System Mounting

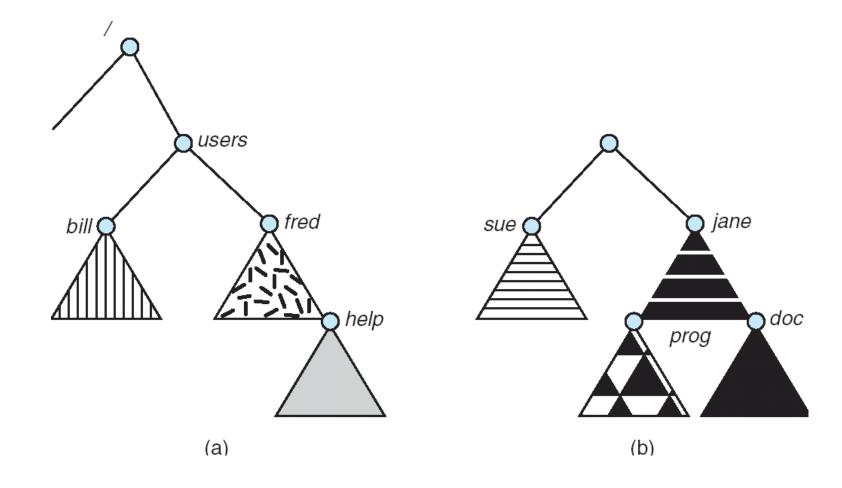

- A file system must be mounted before it can be accessed
- A unmounted file system (i.e. Fig. 11-11(b)) is mounted at a mount point

■ Unix/Linux: mount命令

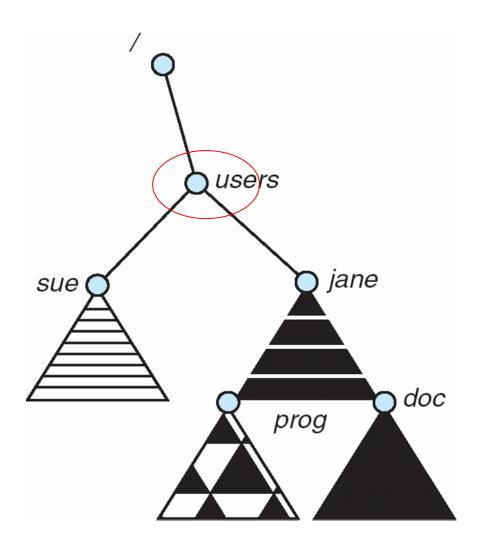

(a) Existing. (b) Unmounted Partition

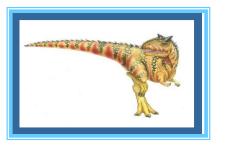

Mount Point

10.5 File Sharing

File Sharing

- 用户本人:
 - Unix类操作系统: 符号链接、硬链接
 - Windows: 快捷方式
- ■多用户
 - Sharing of files on multi-user systems is desirable
 - Sharing may be done through a **protection** scheme
 - On distributed systems, files may be shared across a network
 - Network File System (NFS) is a common distributed file-sharing method

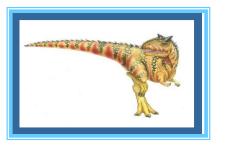

File Sharing – Multiple Users

- **User IDs** identify users, allowing permissions and protections to be per-user
- Group IDs allow users to be in groups, permitting group access rights

10.6 Protection

Protection

- File owner/creator should be able to control:
 - what can be done
 - by whom
- Types of access
 - Read
 - Write
 - Execute
 - Append
 - Delete
 - List

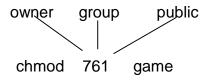

Access Lists and Groups

Unix、**Linux**

- Mode of access: read, write, execute
- Three classes of users

			RWX
a) owner access	7	\Rightarrow	111
,			RWX
b) group access	6	\Rightarrow	110
			RWX
c) public access	1	\Rightarrow	0 0 1

- Ask manager to create a group (unique name), say G, and add some users to the group.
- For a particular file (say *game*) or subdirectory, define an appropriate access.

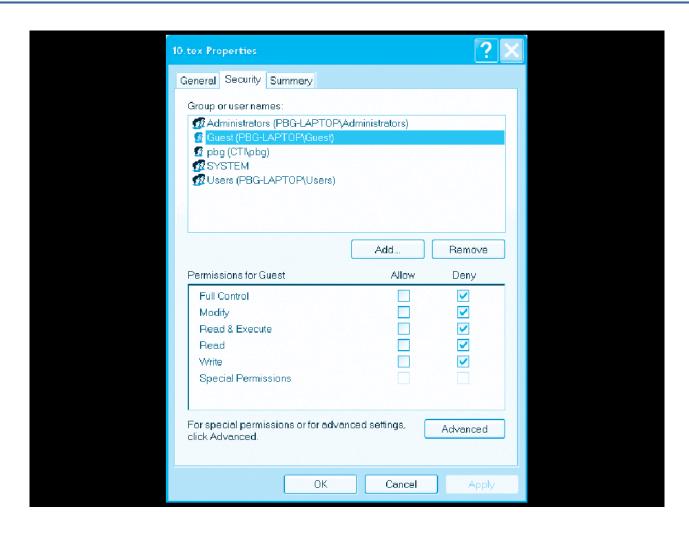

Attach a group to a file:

chgrp G game

Windows Access-control List Management

A Sample UNIX Directory Listing
